Widal

Test	Result	Unit	Biological Ref. Interval
Method	Tube Agglutination		
Salmonella Typhi "O" Antigen	Agglutination (1:30)		< 1:80
Salmonella Typhi "H" Antigen	Agglutination (1:30)		< 1:80
S. Paratyphi "A(H)" Antigen	No Agglutination seen.		< 1:80
S. Paratyphi "B(H)" Antigen	No Agglutination Seen		< 1:80
Interpretation	Widal Test is Negative		Negative

Comments:

- These antibodies titre vary with age, socio economic status, urban or rural areas, past infection, vaccination and antibiotic therapy.
- Agglutination titres of 1:80 and more are significant and rise in the titres or repetition of the test after a few days will confirm the diagnosis of enteric fever.
- Anamnestic Response: Persons who have suffered from enteric infection in the past or who had received TAB vaccine may show appearance of agglutinations in moderate titre when suffering from other unrelated illness.
- TAB vaccination: A moderate rise in titre of all three "H" agglutinins (S. typhi, S. paratyphi A and S. paratyphi B) simultaneously suggestive of recent TAB vaccination.

FINDINGS; The lungs on the either side show equal translucency. The peripheral pulmonary vasculature is normal. No focal lung lesion is seen. The pleural spaces are normal. Both hila are normal in size, have equal density and bear normal relationship. The heart and trachea are central in position and no mediastinal abnormality is visible. The cardiac size is normal. The domes of the diaphragms are normal in position, and show smooth outline. Bony thoracic cage is normal.

IMPRESSION : Normal study

Normal appearance of lung fields.

No evidence of pneumonic consolidation, hilar adenopathy or pleural effusion seen
